

**FATTY ACID CONTENT OF PADDY LEAVES
AFFECTED BY BRONZING DISEASE AS
DETERMINED BY GAS-LIQUID CHROMATOGRAPHY**

Manjula Abeywickrama,

*(Department of Biological Sciences, University of Sri Lanka,
Vidyodaya Campus)*

Analysis of leaf samples by Gas-liquid Chromatography from four Paddy varieties namely BG 34.8, H-9, BG 11.11 and IR 2061-214-2-7-6 0 revealed a higher fatty acid content in those affected by Bronzing disease compared to healthy plants.

The work was supported by the National Science Council.
